

3115-Spring 2023-Arnow QUIZ 02 ANSWERS

QUESTION 1:

When you logged into your account and you typed the command **quiz2**, what was the string that was printed out on the screen?.

--- unique code for each person ---

QUESTION 2:

When the command **date > date.out** is executed in the Linux/Unix command-line interface, what part of the system creates the file "date.out"? What part of the system writes data into the file "date.out"?

The **shell** (the command-line interpreter) reads the string "date > date.out" and upon detecting "> date.out" creates the file "date.out". (If the file already exists, the shell truncates it.)

The **date command** generates the data that gets written into the file itself.
